

### **IN THE CLAIMS**

This listing of claims replaces all prior versions and listings of claims:

1. (Currently Amended) A print terminal comprising:

an image-capturing unit for receiving image data and outputting captured image data;

a display unit that displays a print image superimposed on a print-medium image, said print-medium image comprising a rectangular frame representing an outline of a sheet serving as a print medium; and

an image-processing unit configured to (i) rotate the print-medium image, (ii) rotate the print image by a selected rotation angle, and (iii) simultaneously rotate both the print image and the print-medium image in a common direction by a common rotation angle.

wherein,

said selected rotation angle is selectable within a range of one to ninety degrees, and

said image-processing unit is configured to rotate, in response to input, an orientation of the print medium image relative to the print image.

2. (Canceled)

3. (Previously Presented) The print terminal according to claim 1, wherein rotating the captured image data by a rotation angle less than ninety degrees corrects a tilt of the captured image data.

4. (Previously Presented) The print terminal according to claim 1, further comprising a reader for reading the image data from a recording medium, wherein the image-capturing unit receives image data read by the reader.

5. (Currently Amended) A print system comprising:

a print terminal comprising:

an image-capturing unit for receiving image data and outputting captured image data;  
a display unit that displays a print image superimposed on a print-medium image, said print-medium image comprising a rectangular frame representing an outline of a sheet serving as a print medium[.];

an image-processing unit configured to (i) rotate the print-medium image, (ii) rotate the print image by a selected rotation angle, and (iii) simultaneously rotate both the print image and the print-medium image in a common direction by a common rotation angle, and

a printer for printing the print image on the print medium;

wherein,

said selected rotation angle is selectable within a range of one to ninety degrees,  
and

said image-processing unit rotates, in response to input, an orientation of the print medium image relative to the print image.

6. (Canceled)

7. (Currently Amended) A non-transitory computer-readable storage medium ~~storing~~ having a computer program stored thereon, the computer program, when executed, causes a processor to perform a method comprising the steps of:

displaying a print-medium image and a print image on a display unit, whereby said print image is displayed superimposed on the print-medium image, said print medium image comprising a rectangular frame representing an outline of a sheet serving as a print medium;

controlling, with an image-processing unit, an orientation of the print medium relative to the print image, said image-processing unit being configured to (i) rotate the print-medium image, (ii) rotate the print image by a selected rotation angle, and (iii) simultaneously rotate both the print image and the print-medium image by a common rotation angle; and

displaying on the display unit a print preview of said print-medium image and the print image resulting from said controlling step,

wherein,

said selected rotation angle is selectable within a range of one to ninety degrees,

and

said image-processing unit is configured to rotate , in response to input, said orientation of the print medium relative to the print image.

8-9. (Canceled)
